

L-4

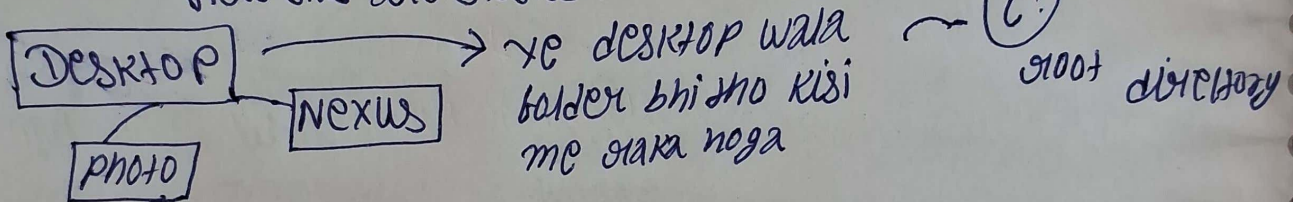

HTML Boilerplate & pixels

⇒ If server have access to my root directory then it can take anything

Computer: video music

How this are stored?

ls → list of file / dir

CD → change dir

* HTML Boilerplate

<!DOCTYPE html> → html ka version 5 hai

<html lang="en"> html Code start language is english
(Done from SEO)

<head> → metadata (data about data)
provide information about whatever you write about in body tag.

< meta charset = "UTF8">

In this document whenever you write in English or other language it will be converted to binary this conversion is through UTF-8 it is a encoding method memory allocation happens through 123 4 bytes

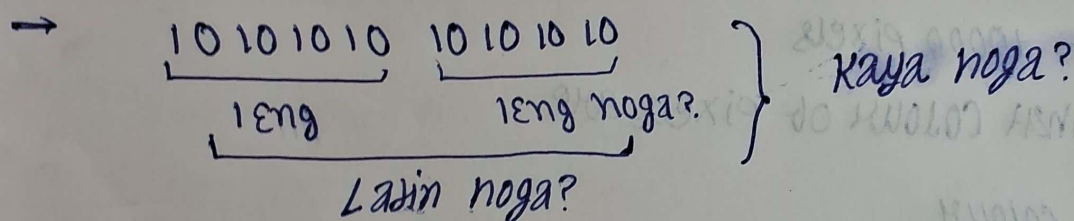

ASCII English - 1 byte

Latin language - 2 byte

Hindi/Chinese/Asian - 3 byte

Emoji - 4 byte

How to determine this data?

* UTF-8 Byte Structure

- 1) 1 byte character: Start with 0xxxxxxx, where x is actual data (7 bits) ASCII's 128 character only
- 2) 2 byte character: Start with 110xxxxx 10xxxxxx (the first 5 bit and 6 bit in 1st and 2nd byte contain actual data)
- 3) 3 byte character: Start with 1110xxxx 10xxxxxx the first 4 bits, the first 6 bits & first 6 bits in 1st 2nd 3rd bytes contain actual data
- 4) 4 byte character: Start with 11110xxx 10xxxxxx 10xxxxxx

< meta name = "view point" content = "width - device-width,
initial-scale = 1.0" >

Area where
web content can
be seen.

device
width

zoom level = 1.0

Img \Rightarrow system kaise store karega ?

\rightarrow 10000 pixels

\rightarrow Total pixels = 10000 pixels

\rightarrow it will store what colour of pixels are

\rightarrow RGB - Base colour

R: 0-255	- 8 bit	} 24 bit - 3-byte
G: 0-255	- 8 bit	
B: 0-255	- 8 bit	

\rightarrow So total size $\rightarrow 10K \times 3 = 30000$ byte = 30KB

\rightarrow For more clarity RGB are stored in 48 bit (6 byte)
